

HydrauTherm™

Non-Electric Combined Heat and Power

- > **Large capacity CoGeneration systems offer significant benefits to their owners BUT they can get "pricey".** That grid interface relay costs about 30% of the price of the generator, and many sites lack the skills to properly service it.
- > This system offers ALL the benefits of a "normal" CoGen package but at a **lower cost AND with some added values.**
- > **HydrauTherm is a TRUE combined heat and Power system.** It also offers two significant benefits- in addition to the lower cost, each major motor has two distinct power sources AND the maintenance people know how to service the system components.
- > By mechanically unloading electric loads, the **operator can decide how much power will be diverted, and when, for the highest value to the site.**
